(See the Editorial Commentary by Gupta and Bhadelia on pages 161–3.)

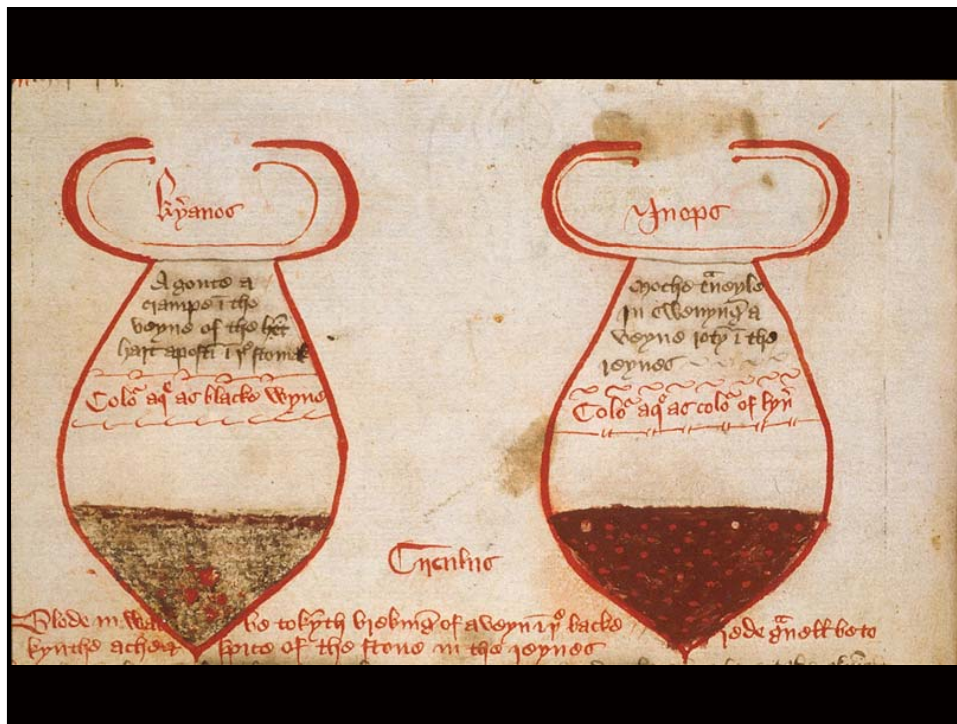

**Background.** Recurrent urinary tract infections (UTIs) are a common problem among women. However, comparative effectiveness strategies for managing recurrent UTIs are lacking.

**Methods.** We performed a systematic literature review of management of women experiencing  $\geq 3$  UTIs per year. We then developed a Markov chain Monte Carlo model of recurrent UTI for each management strategy with  $\geq 2$  adequate trials published. We simulated a cohort that experienced 3 UTIs/year and a secondary cohort that experienced 8 UTIs/year. Model outcomes were treatment efficacy, patient and payer cost, and health-related quality of life.

**Results.** Five strategies had  $\geq 2$  clinical trials published: (1) daily antibiotic (nitrofurantoin) prophylaxis; (2) daily estrogen prophylaxis; (3) daily cranberry prophylaxis; (4) acupuncture prophylaxis; and (5) symptomatic self-treatment. In the 3 UTIs/year model, nitrofurantoin prophylaxis was most effective, reducing the UTI rate to 0.4 UTIs/year, and the most expensive to the payer (\$821/year). All other strategies resulted in payer cost savings but were less efficacious. Symptomatic self-treatment was the only strategy that resulted in patient cost savings, and was the most favorable strategy in term of cost per quality-adjusted life-year (QALY) gained.

**Conclusions.** Daily antibiotic use is the most effective strategy for recurrent UTI prevention compared to daily cranberry pills, daily estrogen therapy, and acupuncture. Cost savings to payers and patients were seen for most regimens, and improvement in QALYs were seen with all. Our findings provide clinically meaningful data to guide the physician–patient partnership in determining a preferred method of prevention for this common clinical problem.

**Keywords.** urinary tract infection; recurrent; management.

## Background: Urinary Tract Infection (UTIs)

- Common infection in adult women
  - 10-13% experience a UTI annually
  - Lifetime risk > 50%
  - Annually in U.S.
    - >6 million outpatient visits
    - 479,000 hospitalizations

Foxman B et al. *Ann Epidemiol.* 2000;10:509-515  
Griebling TL. *J Urol.* Apr 2005;173:1281-1287

## Background: Urinary Tract Infection (UTIs)

- UTIs cause
  - Pain
  - Restriction of work and school
  - Bed rest
  - \$2.4 billion in U.S. annually

Griebling TL. *J Urol.* Apr 2005;173:1281-1287  
Foxman B et al. *Am J Public Health* 1985;75:1308-1313

## Background: Recurrent UTIs

- Common problem in clinical practice
- Among women w/ UTI in next 6 months
  - 20-30% Have a second UTI
  - 3% will experience a third UTI
- Defined by experts as  $\geq 3$  UTIs during a one-year time span

Foxman B. *Am J Public Health* 1990;80:331-333  
Nicolle LE et al. *Infect Dis Clin North Am* 1987;1:793-806  
Pfau A et al. *J Urol* 1983;129(6):1153-1157

## Background: Recurrent UTIs

- Represent challenge for treating physicians
- No clear ideal prevention strategy
- No comparative trials of strategy

## Background: Recurrent UTIs

- Treatment Prevention Strategies
  - Antibiotic prophylaxis
  - Estrogens
  - Cranberry juice/supplement
  - Self-diagnosis/self-treatment
  - Acupuncture
  - *Lactobacillus*
  - Vaccine

## Hypothesis

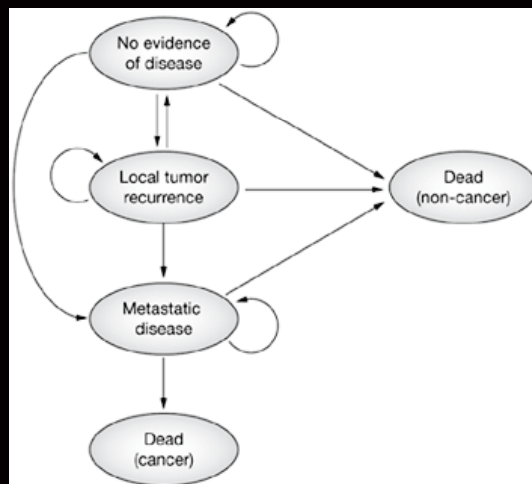

- We hypothesized that preferred treatment strategies to prevent recurrent UTIs would differ depending on the outcome of preference

## Investigation Aim

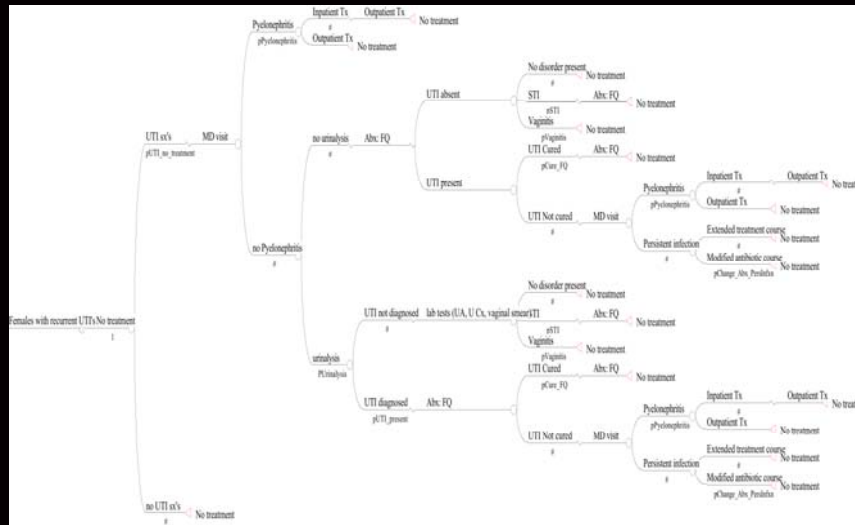

- Quantify outcomes of recurrent UTI strategies
  - Effectiveness
  - Cost
  - HRQOL

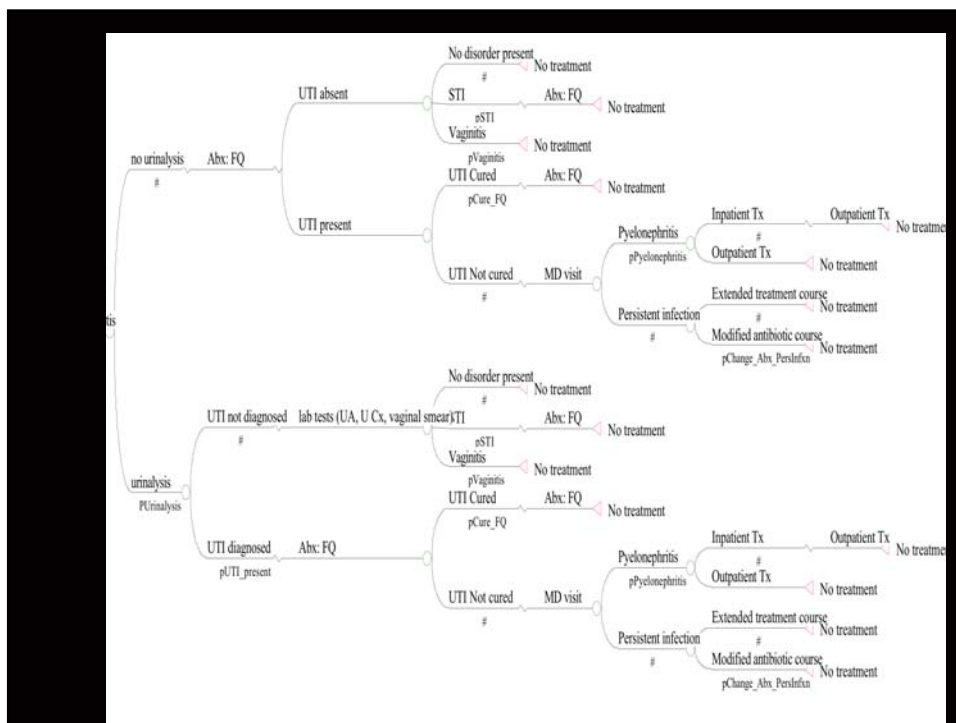

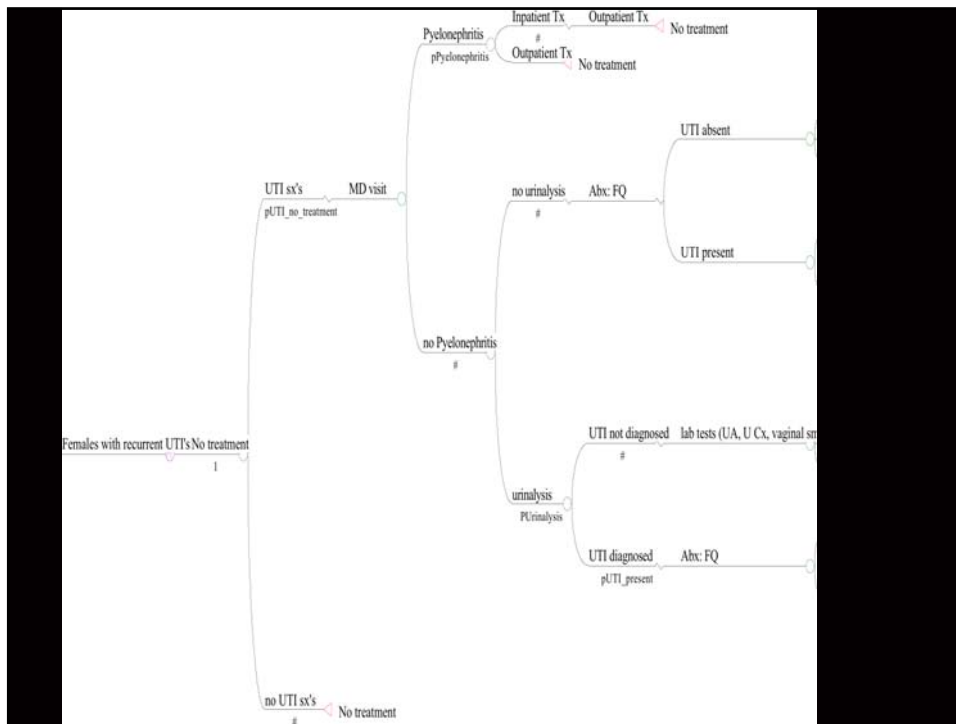

## Methods

- Markov decision analysis
- Monte Carlo simulation
  - Cohort of patients undergoing each strategy
  - Cohort of “control” patients with no intervention
- Systematic review of literature of efficacy

# Markov Model

## Methods

- Outcomes measured:
  - Number of UTIs/year
  - Annual cost from the payer's (i.e., health plan's) perspective
  - Annual cost from the patients' perspective
  - Quality-adjusted life-days (QALD).
    - As opposed to QALY ( $QALD = QALY / 365$ )

## Methods

- Software program
  - DATA (version 4.0, TreeAge Software, Williamstown, MA)

## Methods

- Systematic literature review
  - MEDLINE, Embase, and Cochrane Library databases
  - Searched for articles from 1966 to Jan. 2012
  - Keywords:
    - recurrent [recur\*]
    - urine or urinary [urin\*] AND
    - infectious or infection(s) [infectious, infection\*].

## Methods

- Two reviewers assessed each abstract
  - If both believed abstract might contain:
    - Data on management strategy for recurrent UTIs or
    - Review article that may reference such data
  - Then article was pulled for review
  - If the reviewers differed, 3<sup>rd</sup> reviewer tie-broke
  - Reference lists of retrieved articles also reviewed for additional (missed) studies

## Methods

- Inclusion criteria for study population
  - Adult (>18 years of age) non-pregnant females
  - Study population with  $\geq 3$  UTIs per year
  - Comparative clinical trial:
    - Using either an untreated/placebo control group or
    - Quantified patients' pre-intervention and post-intervention UTI incidence
  - English abstract and/or text

## Methods

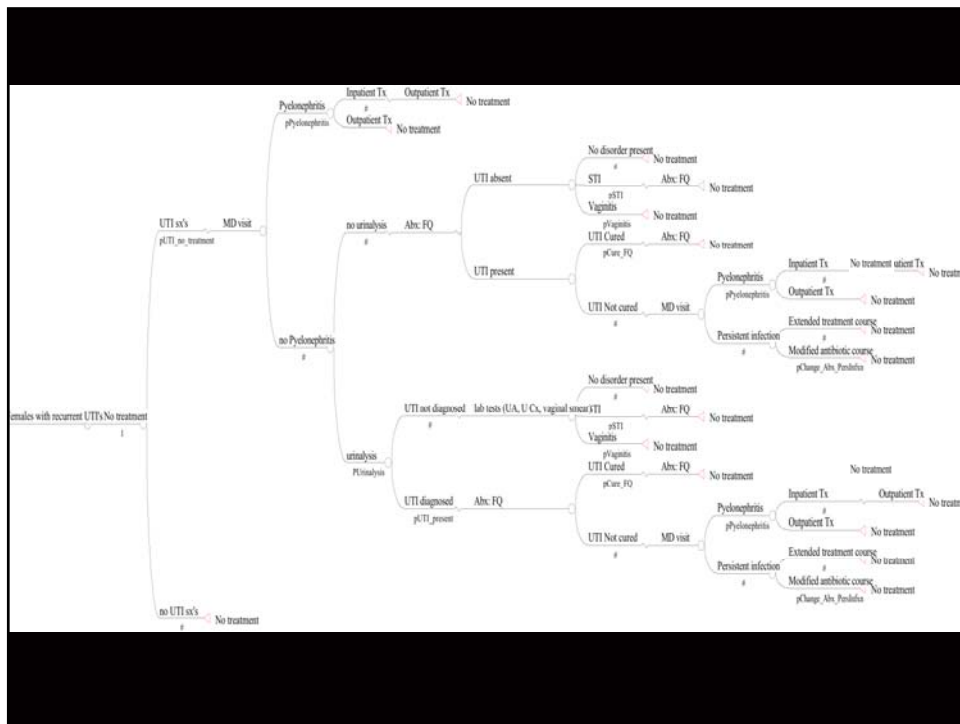

- Probability of UTI prevention
  - Obtained from articles presenting original data
  - Risk reduction calculated by comparing Tx strategy to control or pre-intervention group
- Pooled mean risk reduction weighted by study sample size
- Only modeled interventions with  $\geq 2$  published investigations

## Methods

- Monte Carlo simulation
  - 10,000 subject simulations
  - One day Markov cycle
  - Untreated group has mean 3 UTIs/year
  - Second set of models with 8 UTIs/year
  - Probabilities from literature search
    - Risk reduction decreased UTI risk by x%

## Methods

- Monte Carlo simulation
  - Patients present with Sx's of UTI
    - Most with cystitis, small probability of STI, vaginitis
  - UTIs
    - Required visit to MD
    - Treated with systemic antibiotics
    - Most present with cystitis, some w/ pyelo
    - Small proportion require hospitalization

## Costs

- Costs:

- Program (payer) perspective
- Patient perspective

## Methods

- Costs:
  - Hospitalization: American Hospital Association
    - 10% cost burden on patient
  - MD visits: CMS
  - Pharmaceutical costs: Red Book
    - Patient co-pay
  - Cranberry: pill costs from 3 national commercial pharmacies (mean costs)
  - Acupuncture: survey of 30 clinics (mean cost)
  - Lab costs: survey of 2 major commercial labs

## Methods

- HRQOL:
  - Taken from generic health states from the literature

Kaplan RM et al. *J Chronic Dis* 1984;37:85-95

## Methods

- Taken from generic health states from the literature
- HRQOL states examples
  - Perfect health 1.0
  - UTI (“Painful, burning, or frequent urination”) 0.9673
  - Pyelonephritis (“fever or chills with aching all over and vomiting or diarrhea”) 0.9288

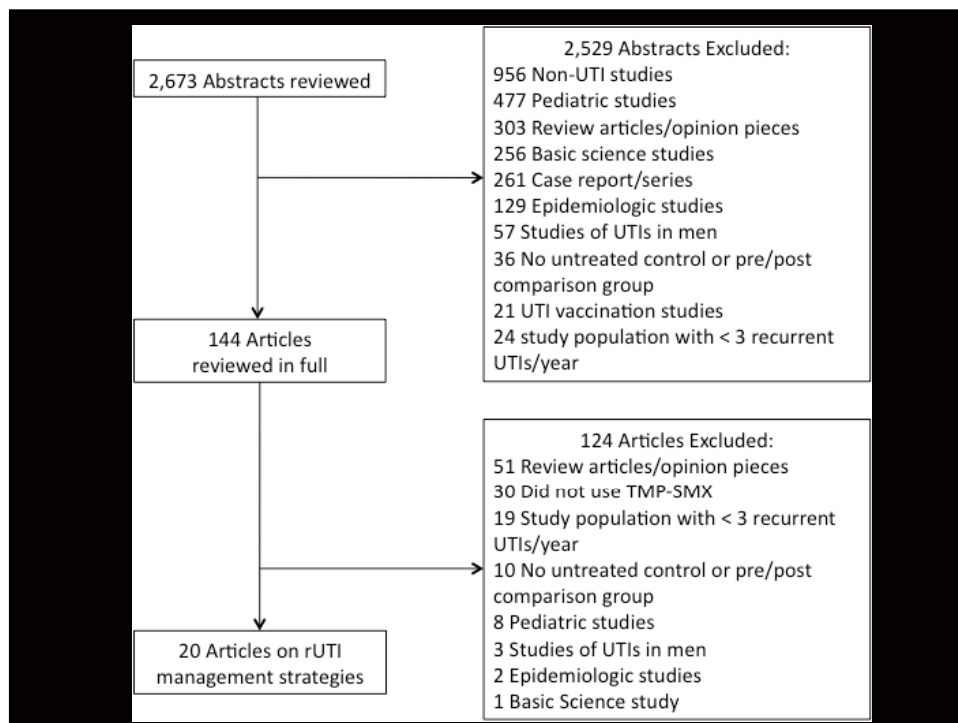

Kaplan RM et al. Health status: types of validity and the index of well-being. *Health Serv Res.* 1976; 11(4): 478–507.

## Methods

- One-way sensitivity analyses:
  - Performed for each
    - Probability
    - Cost
    - QALD value
  - Each value ranged over the minimal & maximal values determined from the literature or cost survey

Kaplan RM et al. *J Chronic Dis* 1984;37:85-95

# RESULTS

## Results

- The systematic literature review yielded 2,791 articles
- We found 20 articles that were clinical trials of UTI prophylaxis for UTIs that met our criteria
  - Antibiotic prophylaxis (n=6)
  - Estrogen prophylaxis (n=5)
  - Acupuncture prophylaxis (n=2)
  - Cranberry prophylaxis (n=4)
  - Self-treatment (n=3)

## Results

**Table 1. Probability values for variables in model**

Description	Probability	Range of probabilities tested	References
Acupuncture risk reduction	0.68	0.6-0.7	24,25
Cranberry risk reduction	0.50	0.4-0.8	9,10,16,17
Daily antibiotics/Nitrofurantoin, 100 mg bid risk reduction	0.86	0.6-1.0	11,19-23
Estrogen use risk reduction	0.65	0.3-1.0	12-15,18

Clinical cure of fluoroquinolone-sensitive infection treated with fluoroquinolone	0.94	0.9-1.0	45,64-66
Vaginal yeast infection after ≤3 days of therapy	0.05	0-0.2	33,66,67
Vaginal yeast infection after >3 days of therapy	0.07	0-0.2	45,68,69
Medical visit for vaginal yeast infection	0.25	0-0.5	53
Change of therapy due to lack of clinical response (versus extending treatment)	0.75	0-1	32,33
Physician orders urine analysis	0.769	0.25 - 1	39
UTI when symptoms are present	0.8481	0.6 - 1	26-28
Pyelonephritis	0.04	0.00 - 0.08	32,33,37,38
Outpatient treatment for pyelonephritis	0.80	0.5 - 1	32,33
STI present	0.157	0 - 0.5	40
Vaginitis present	0.133	0 - 0.5	40,41
No disorder present	0.709	0.5 - 1	41

## Results

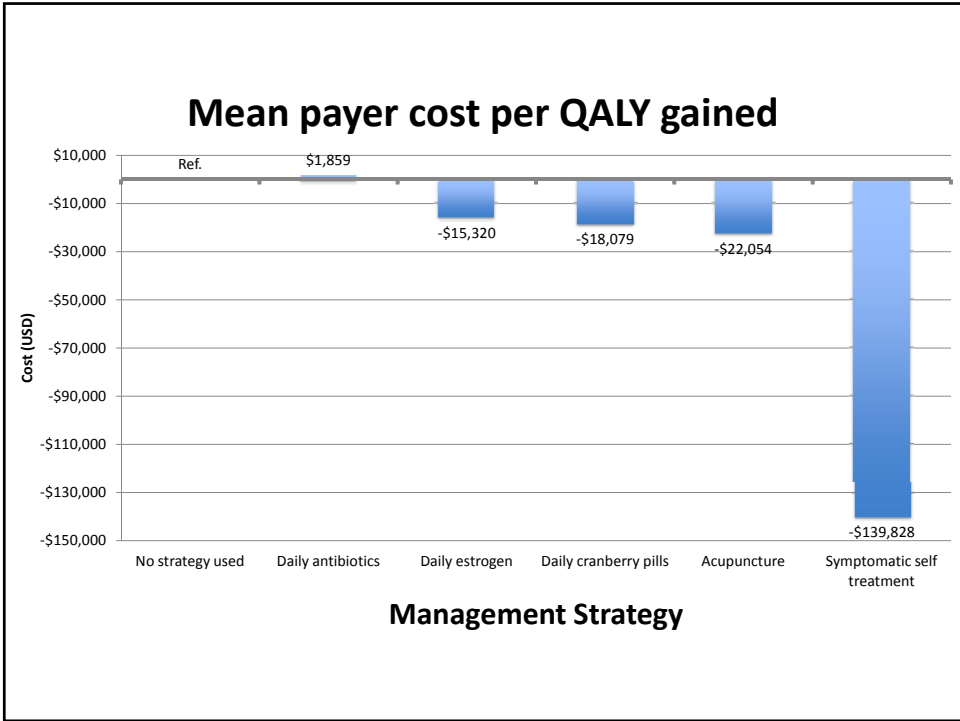

**Table 2. Cost of interventions to prevent or treat recurrent urinary tract infections and duration of clinical events**

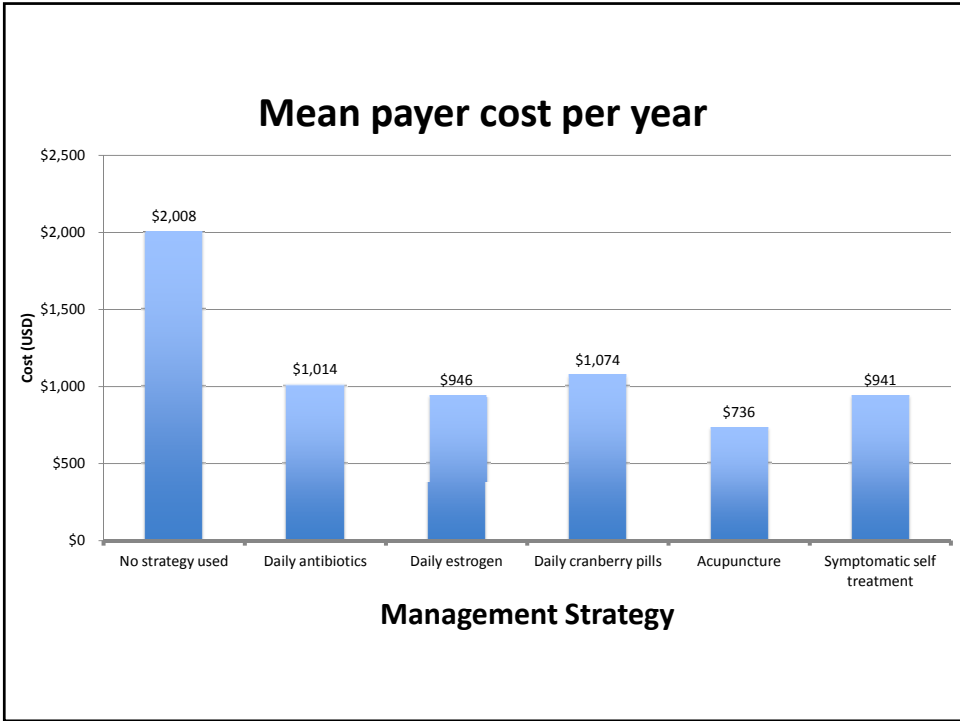

Description	Mean cost per unit time or per item (US dollars)	Range tested (US dollars)	References
Acupuncture, initial session fee plus each monthly session	2.51/day	1.37-4.60	See text
Cranberry pill	0.75/day	0.13-2.25	See text
Estrogen	0.50/day	0.14-31.63	<sup>88</sup>
Daily antibiotics/Nitrofurantoin, 100 mg bid (AWP)	1.95/day	1-4	<sup>48</sup>
Ciprofloxacin, 250 mg bid (AWP)	4.44/day	2-10	<sup>48</sup>
Ciprofloxacin, 500 mg bid (AWP)	5.38/day	2-11	<sup>48</sup>
Self-treatment for yeast infection	16.14	8-32	See text
Hospitalization for pyelonephritis	1782.28/day	850-3600	<sup>49</sup>
Outpatient treatment for infection unresponsive to fluoroquinolones or pyelonephritis	29.77/day	15-60	<sup>48</sup>
Follow-up physician visit	97.77	65-132	<sup>30-33</sup>
Initial urinalysis	20.78	10-42	See text
Follow-up urinalysis	20.78	10-42	See text
Urine culture	46.42	23-93	See text
Vaginal smear	13.50	10.65-16.25	See text
STI test	67.60	20-155	See text
Description	Duration (days)	Range (days)	References
Hospitalization for pyelonephritis	3	1-5	<sup>36,37</sup>
Outpatient treatment for infection unresponsive to fluoroquinolones	5	3-10	<sup>37</sup>
Outpatient treatment for pyelonephritis	7	5-14	<sup>64,70</sup>

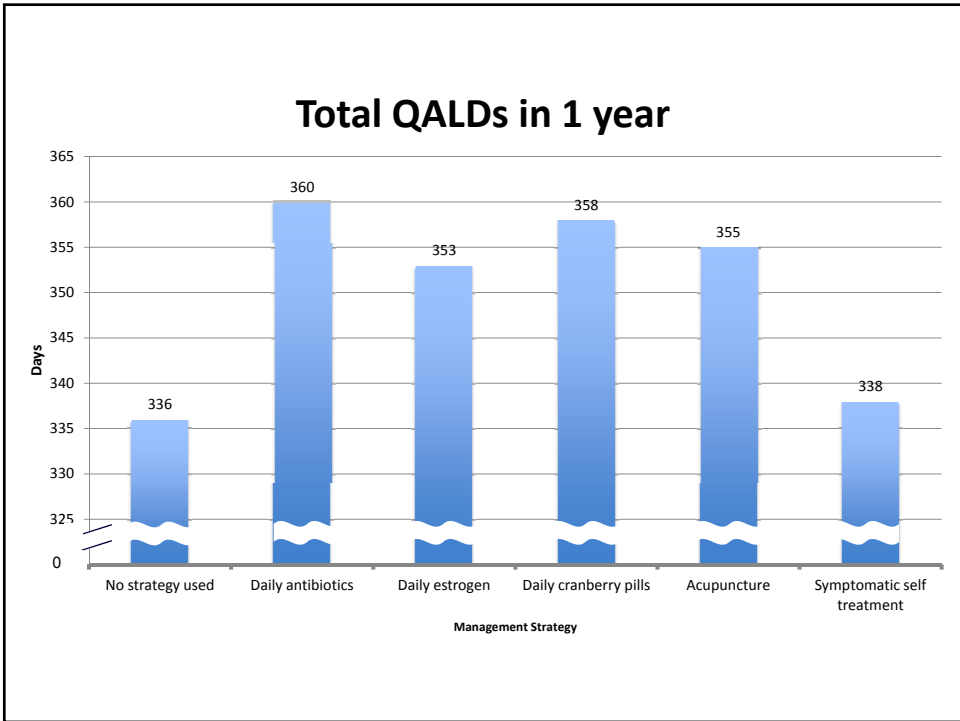

## Results from Payer's Perspective (3 UTIs/Year)

Strategy	Number of UTI/year	Mean payer cost/year	Change in cost to payer	Mean payer cost/UTI prevented	Total QALDs in 1 year	QALD gained/year	Mean payer cost/QALY gained
No strategy used	3.0	\$771	REF	REF	353	REF	REF
Daily antibiotics	0.4	\$821	-\$50	-\$19	363	9.8	-\$1,859
Daily estrogen	1.1	\$452	-\$319	-\$168	361	7.6	-\$15,320
Daily cranberry pills	1.1	\$444	-\$327	-\$172	360	6.6	-\$18,079
Acupuncture	0.7	\$269	-\$502	-\$218	362	8.3	-\$22,054
Symptomatic self treatment	3.0	\$350	-\$421	N/A	355	1.1	-\$139,828

## Results from Payer's Perspective (8 UTIs/Year)

Strategy	Number of UTI/year	Mean payer cost/year	Change in cost to payer	Mean payer cost/UTI prevented	Total QALDs in 1 year	QALD gained/year	Mean payer cost/QALY gained
No strategy used	8.0	\$2,008	REF	REF	336	REF	REF
Daily antibiotics	1.3	\$1,014	-\$994	-\$148	360	24.2	-\$14,998
Daily estrogen	3.1	\$946	-\$1062	-\$217	353	17.5	-\$22,154
Daily cranberry pills	4.4	\$1,074	-\$934	-\$259	358	22.1	-\$15,427
Acupuncture	2.8	\$736	-\$1272	-\$245	355	19.3	-\$24,050
Symptomatic self treatment	8.0	\$941	-\$1067	N/A	338	2.2	-\$177,008

## Results from Patient's Perspective (3 UTIs/Year)

Strategy	Mean patient cost/year	Change in cost to patient	Mean patient cost/UTI prevented	Mean patient cost/QALY gained
No strategy used	\$139	REF	REF	REF
Daily antibiotics	\$140	\$1	\$0	\$19
Daily estrogen	\$169	\$30	\$15	\$1,412
Daily cranberry pills	\$341	\$202	\$106	\$11,121
Acupuncture	\$946	\$807	\$351	\$35,467
Symptomatic self treatment	\$69	-\$70	N/A	-\$23,260

## Results from Patient's Perspective (8 UTIs/Year)

Strategy	Mean patient cost/year	Change in cost to patient	Mean patient cost/UTI prevented	Mean patient cost/QALY gained
No strategy used	\$365	REF	REF	REF
Daily antibiotics	\$178	-\$187	-\$28	-\$2,822
Daily estrogen	\$261	-\$104	-\$21	-\$2,167
Daily cranberry pills	\$458	\$93	\$26	\$1,541
Acupuncture	\$998	\$633	\$122	\$11,971
Symptomatic self treatment	\$181	-\$184	N/A	-\$30,444

## Results: Sensitivity Analysis

- Payer costs sensitive to:
  - Estrogen costs (\$0.50/day)
    - 30% reduction if estrogen cost was \$0.14/day or a 2400% increase if the cost was \$32/day
  - Antibiotic prophylaxis
    - 43% cost reduction to 89% cost increase
- Other costs had lesser effects

## Results: Sensitivity Analysis

- Patient costs sensitive to:
  - Cranberry pills
    - 64% cost reduction to 155% cost increase
  - Acupuncture
    - 43% cost reduction to 79% cost increase
- Other costs had lesser effects

## Results: Sensitivity Analysis

- Probabilities with influence on results
  - Antibiotic prophylaxis
    - 0.0 to 1.2 UTIs/year
  - Pyelonephritis probability
    - 23% decrease to 346% increase in payer costs
  - QALD affected by FQ treatment cure %
    - 348-361 QALD (baseline 353)

## Summary

- Daily antibiotics
  - Least expensive for patient
  - Cost for payer
    - Cost savings for 8 UTI/year model
    - Modest cost (\$50 year) for 3 UTI/year model

## Summary

### ● Acupuncture

- Least expensive for payer
- Very expensive for patient
- Of note
  - Access to treatment poorly understood
  - Efficiency of intervention poorly understood
  - Ideal regimen unclear
    - In studies, Rx administered 2x/week x 4 weeks & women then followed x 6 months

## Summary

### ● Daily estrogens, cranberry

- Similar reductions in UTIs
  - 1.1 UTIs/year for 3 UTI/year model
- Similar payer costs, QALY gained
- But cranberry very expensive to patient

## Summary

- Daily estrogens
  - Optimal method unclear
    - Oral, transdermal, vaginal
  - May not be tolerated by some women

## Summary

- Symptomatic self-treatment
  - No reduction in UTIs
  - Minimal improvement in QALY
  - Very cost effective to patient, provider
  - May be very attractive to some persons, very unattractive to other

## Limitations

- Model had many many assumptions
- Only based on published data
  - Publication bias
- Quality of some clinical trials relatively poor
  - Double blind placebo controlled RCTs ideal but rare
- Cost of medications not as clear as expected

## Limitations

- Long term tolerability, efficacy not modeled
  - But rare events have minimal effects on cost in prior studies
- CAM interventions not well standardized
- No disease specific HRQOL measures
- Models not stratified by patient related factors, e.g., age
  - Model assumed patients in perfect health
- Didn't perform credibility ranges

## Strengths

- Multiple complementary outcomes
- Multiple perspectives
- Systematic review of the literature
- Summary, comparative outcomes

## Implications

- Interventions to prevent UTIs
  - Generally efficacious
  - Cost-effective
- Data will help patients/provider partnership individualize treatment strategy
